

Eyes in the Sky

How Satellites See
Climate, Flora and
Fauna

Before we get started

- Install HomeBrew from <http://brew.sh/>
- Download ImageJ from <http://rsbweb.nih.gov/ij/download.html>
 - Select the installation bundled with Java

Let's access some data!

- On Firefox, go to glovis.usgs.gov
 - Username: ase2016
 - Password: space2016
- On **Map Layers**, select **All Layers**

Set an Intention

- There's a lot of data in these archives, so we want to focus on an interesting place and time period.
- Focus on the area you've lived in for most of the last 5 years.
- Was there a hurricane, earthquake, or other short-term event there recently?
- Was there a forest, or other type of fire? An explosion at a power plant?
- What month and year was this event?

Sorry to be forcing you to remember sad events – but that's where this short tutorial will be most useful. And with these tools, you can help in the future!

Let's access some data!

- On Map Layers, click on “Search for Address”
 - Enter the name of the city and country where you came from
 - In **Tools**, select **Search Limits**
 - Select “Show only downloadable scenes”
 - Select the month of interest.
 - On the bottom left, click “Add”
 - Repeat for 1 scene before and your selected date
- Click **Send to Cart**
- Download everything. The TIFF files will take ~10 min each

Story time!

The Lure of a Bird's Eye View

- Earliest aerial images were taken from balloons, such as *Le Geant* built by Spanish polymath Nadar in 1854
- Key principle: $\theta = \frac{s}{d}$
 - Our eyes always cover a constant **angular** size
 - So if we look farther away, we see more things
- **Field of view** is larger at farther distances

Le Geant

196 foot tall balloon

Sewn by over 300 seamstresses from 220,000 yards of silk

Reached altitude of 4000 ft = 1.22 km

This is how it saw Paris in 1867

More Balloon Photos

James Wallace Black, 1860

The Giza Pyramid Complex
Eduard Spertelini, 1904

Adding Depth to Width: Stereoscopy

DIY Hacks & How Tos

Stereoscopic Photography

Activity Break – Let's Make a Stereograph!

Wide field + depth = great maps!

During World War I, people realized that aerial images enhanced cartography

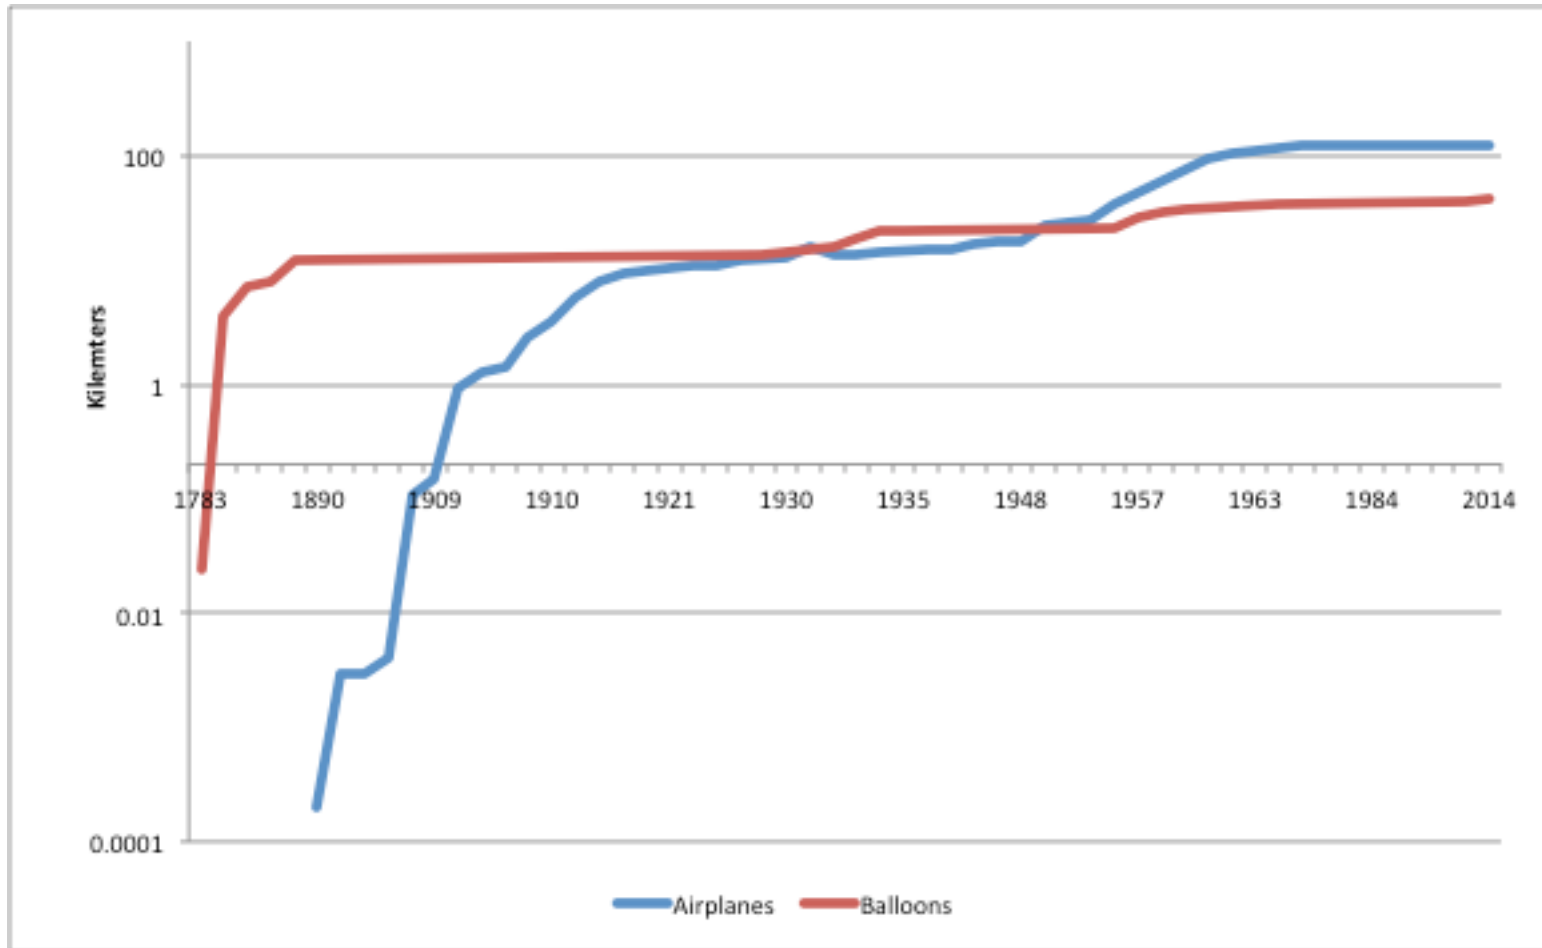

Checkpoint 1

Aerial Imaging Allows us
Width **and** Depth
of Perception

Dwarfing the Giant

So we've learned that higher is better.

Dwarfing the Giants

So we've learned that higher is better.

- ~600-800 km above Earth
- Orbital period 96-100 min
- Great for relatively shallow coverage of large areas

Just how much can we see from space?

2. Geo-synchronous satellites

Orbital period equals that of earth

$$F_{centripetal} = F_{gravity}$$

$$\frac{v^2}{r} = \frac{GM_{\oplus}m_{sat}}{r^2}$$

$$P = \frac{2\pi r}{v} = P_{\oplus}$$

$$\left(\frac{2\pi r}{P_{\oplus}}\right)^2 = \frac{GM_{\oplus}}{r} \Rightarrow r = \sqrt[3]{\frac{GM_{\oplus}P_{\oplus}^2}{4\pi^2}}$$

$$r = 42160\text{km}$$

$$\begin{aligned} \text{Altitude} &= r - \text{radius of Earth} \\ &= 35,800\text{km} \end{aligned}$$

Just how much can we see from space?

2. Geo-synchronous satellites

Who operates remote sensing satellites?

- Government agencies

Also, any country with a space mission!

- Private Sector Firms

BLUE
ORIGIN

Checkpoint 2

Government and private agencies operate helio-synchronous (polar) and geo-stationary satellites

A Little Inspiration – Urbanization

Fake color image of the Portland, OR area 1984-2007

Time to make composites!

- Tutorial: pages 13-14
<http://landsat.gsfc.nasa.gov/wp-content/uploads/2013/05/Make-Your-Own-Landsat-Image-Tutorial.pdf>
- The different bands are used to track different things
 - Combinations are named by band # used as R, G and B
 - True color = 3-2-1. What you would see from an airplane.
 - False color or NIR = 4-3-2. The green vegetation reflects infrared (band 4), so shows up as red in these images.
 - Pseudo Natural Color or SWIR = 7-4-2. Bare soil and burn marks show up as purple and pink.

Which Filter Why

Ground Cover Type:

Trees and bushes
Crops
Wetland Vegetation
Water

Urban areas
Bare soil

In Natural Color (3,2,1), appears:

Olive Green
Medium to light green
Dark green to black
Shades of blue, green, and brown
White to light blue
White to light gray

In False Color: (4,3,2), appears:

Red
Pink to red
Dark red
Shades of blue

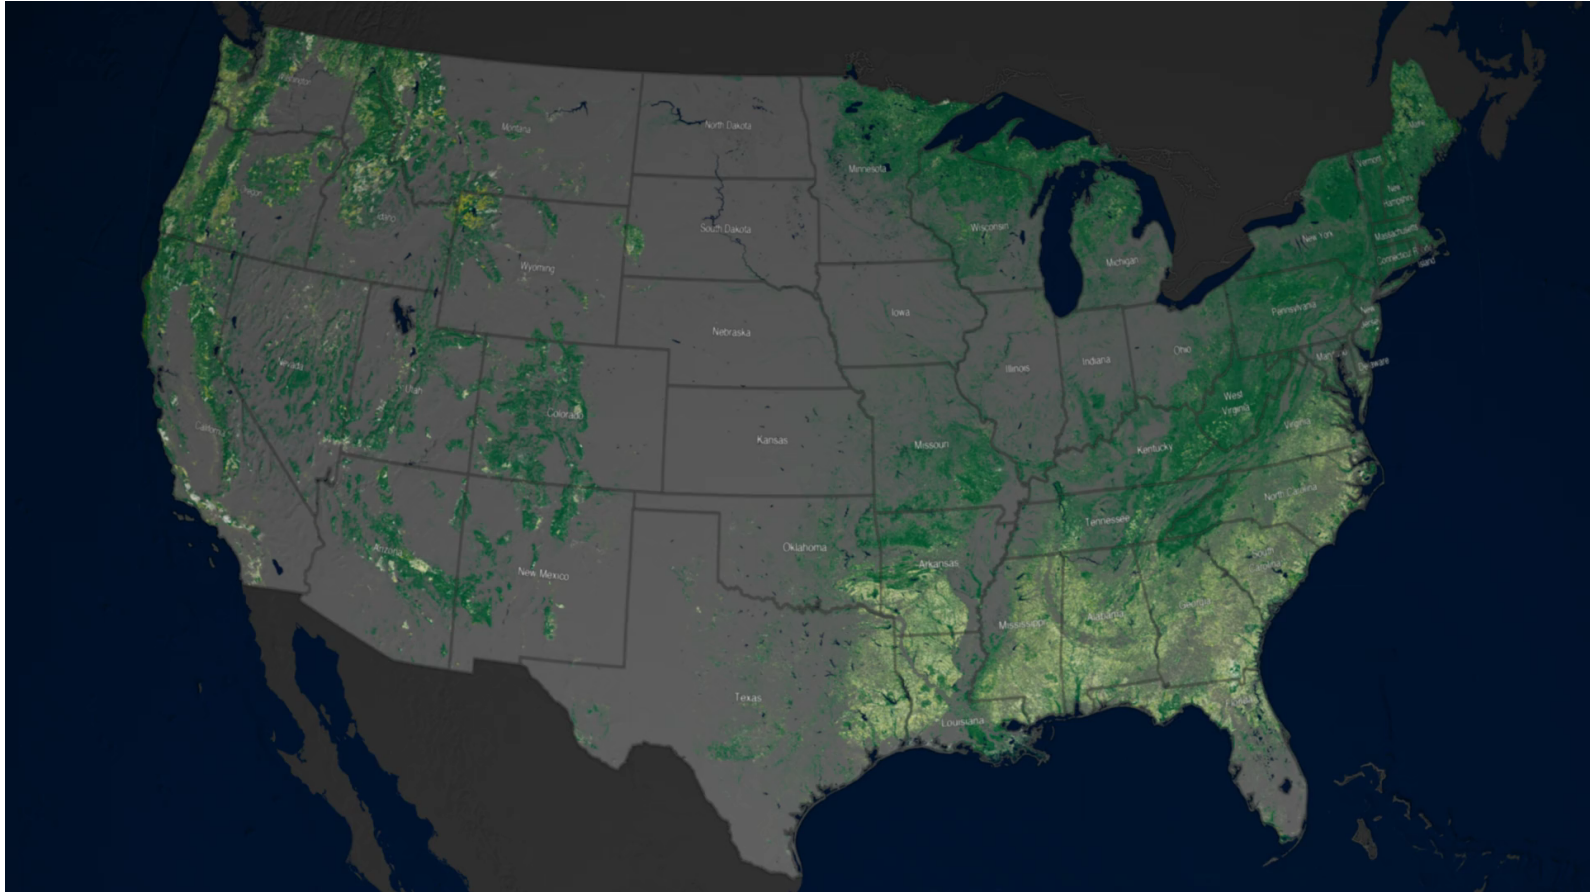

Blue to gray
Blue to gray

In Pseudo Natural Color (7,4,2), appears:

Shades of green
Shades of green
Shades of green
Black to dark blue

Lavender
Magenta, Lavender, or pale pink

A Little More Inspiration – Deforestation

True color images of protected areas in the US, 1986-2008

Summary

- Satellites take images of large areas of land
 - Over long time scales
 - In different filters
- Combinations of these filters can track

Population

Emergency Response

Free Satellite Data

Forest Fires

Landslides

- These images can be accessed from space agency archives
- Time-lapses help build perspective on large scale phenomena!

Questions? Ideas!
